

Stock transactions

- [Overview](#)

Overview

Stock transactions are automatically generated data entries, used for tracking stock of materials, products, serials and other goods within the ERP system.

These entries are created **automatically**, when an action involving any kind of stock change is performed. This includes, among others, goods receipts, goods transfers and goods write-offs.

Because these entries are created through automation within the system, **they cannot be created, edited or deleted by users.**
