

Create new system option

This action requires the "**create system option**" permission.

A new option can be created by accessing the creation form on the [system options page](#) through the "Create new" button.

You get redirected to the [creation form page](#), where you can input required information to add a new system option.

All required form fields are marked with a red asterisk.

A screenshot of the 'Add new option' form. The form is titled 'Add new option' and has a 'Basic information' section. It contains several input fields: 'NAME' (with a red asterisk), 'SLUG' (with a red asterisk and the placeholder 'Enter unique slug'), 'VALUE', and 'DESCRIPTION'. There is also a 'DATA' field and a 'JSON preview' area. At the bottom, there is a red banner indicating 'Invalid fields' with 'Name' and 'Slug' listed. A 'Save' button is visible, along with a checkbox for 'After save, create another'.

Be careful, as you should define only either value or data. If both are defined, only value will be used.

Revision #10
