

# Access & authorization

Users are mainly granted access through **permissions, roles** (groups of permissions) or with **specific authorizations**.

The screenshot shows a configuration page titled "Authorisation". It contains several sections with role-based access controls:

- ROLES:** A list of roles: "Super administrator", "Employee", and "Team member", each with a close button (x).
- PERMISSIONS:** A section with a dropdown arrow and a count of 0.
- AUTHORIZED FOR PARTNERS:** A section with the text "Select partners".
- AUTHORIZED FOR COUNTRIES:** A section with a list of countries: "Slovenia" and a close button (x).
- AUTHORIZED FOR USERS:** A section with a list of users: "Jure Jager, jure.jager@dewesoft.com" and a close button (x).
- AUTHORIZED FOR PRODUCTS:** A section with the text "Select products".
- PRICE LISTS:** A section with a list of price lists: "Test" and a close button (x).

## Permissions

Users are granted access primarily through permissions.

Permissions control access of most aspects of the ERP system, which include what pages can be visited, what types of entries can be viewed / deleted / created, which links are displayed in the menu...

The screenshot shows a configuration page titled "Make requests to ChatGPT". It contains a "Basic information" section with the following fields:

- NAME:** "Make requests to ChatGPT" (with a red star icon).
- SLUG:** "ai-chat-gpt" (with a red star icon).
- GROUP:** "AI".
- DESCRIPTION:** "user with this permission can access the ChatGPT instance, connected to the ERP."
- ROLES:** A list of roles: "employee" and a close button (x).

Regular permissions provide complete access, while permissions with the "authorized" suffix grant limited access only to authorized content.

Main types of permissions, that exist for each table, are **Create**, **View**, **Update**, **Delete**, and **Menu**.

## Roles

Roles are primarily used to group permissions, that are often assigned together under a single name to ease access management.

They can also be used in an informational manner, to essentially "**tag**" a user as for example, an employee or a shop customer. Roles can be assigned directly onto users or to their active work positions, defined within the HR module.
