How SKUs are generated

Every **product** can have only **one SKU** and every **SKU has to be unique.** Duplicate SKU-s are not supported.

AAA.0000000.000

AAA — The SKU prefix is generated from two pieces of information. The first letter is taken from the selected **product type**, while the remaining two letters are determined by selected **product classification**.

.0000000 — The middle of the SKU is always a 7-digit number that denotes, which consecutive product with this prefix it is.

.000 — The SKU suffix is the revision number. If a revision number is not defined, the default is always set to 000.

Example: MME.0038447.11B

In this example, the prefix **MME** stands for **Materials, Metal** (M - Materials, ME - Metal), the number **0038447** means, that this is the 38447th MME product. The suffix **11B** means that the product **revision** is 11B.

Revision #17
